### Cash Register:

A business Machine that usually has a money drawer, indicates the amount of each sale and records the amount of money received.

An electronic device is used to calculate financial transactions. Most cash registers consist of a keyboard that is used to input entries, a scanner of some sort, a drawer that is used to hold cash, and a printing device for receipts. With the advancement of technology, cash registers are able to do a wide variety of additional functions including credit card processing, personal check verification, and inventory tracking.
